This receptor can additionally serve as a tool for the drug design of novel therapeutic agents for indications including ischaemic heart diseases (e.g. myocardial infarction and angina performs). Stroke due to representations of the provential infarction and angina including the receptor can additionally serve as a tool for the drug design of novel therapeutic agents for indication and angina
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel nucleic acid (I) encoding a human lysophosphate acid (LPA; 1-acyl-glycerol-3-phosphate) receptor. Probables which hind to the LAP receptor can be used for detecting expression of a mammalian LPA receptor. The probe can be used for expression predignosition to a discrete associated with LPA receptor activity. The transpectic animals incorperating the LPA receptor activity of mammalian LPA receptors, or for identifying an (ant)agonist activity of mammalian LPA receptors, or for identifying an (ant)agonist

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to methods of detecting (ant)agonist, inverse agonist or allosteric modulators of the lysobosphatible and the egents agonist or allosteric modulators of the lysobosphatible and read to EEG-1, EEG-2, FEG-3, FEG-4, FEG-5, and EEP-24. The methods are used to identify (ant)agonists and allosteric modulator of the lysophosphatidic acid (LPA) EEG2 receptor, e.g. to treat LPA signalling mediated disease acid (LPA) EEG2 receptor, e.g. to treat LPA signalling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                EPG-1, EPG-2, EPG-3; EPG-4, EPG-5, PSP-24, human, detection; therapy; inverse agenist; allosteric modulator, lysophosphatidic acid receptor; LPA signalling mediated disease; cellular apoptosis.

                                                                                                                            Poptides which bind to the DNA binding domain of transcription factor E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and DP 1, or the activation of transcription by E2F 1/EP-1 heterodimers. They may also be used for inducing apoptosis and/or cell cycle arrost in a cell, particularly for treatment of cancer or other proliferative discretization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptides which bind to the DNA binding domain of transcription factor E2F and inhibit cell cycle progression may be useful as research agents to investigate the interaction between E2F and DP-1, or the activation of transcription by E2F-1/DP-1 betweenters: They may also be used for inducing apoptosis and/or cell cycle arrest in a cell, particularly for treatment of cancer or other proliferative

                                                                                                                                                                                                                                                                 Poptides AARAGO24-R96236 are examples of peptides and their mimerics of this bind to endothelial leukocyte adhesion molecule (ELAM) This complete molecule is a member of the selectin family of receptors and is involved in binding of leukocytes to the vascular endothelial wall prior to complete the peptides bind pref to E-selectin bind by or complete to the peptides bind by the leukocyte, e.g. to a site of inflammation.

Complete the peptides bind pref to E-selectin bind by also bind by the peptides bind by the selectin, and can be used to treat conditions mediated by E-selectin, complete the strong affinity for the selectin receptors and inhibit the binding of the staly lewis (SLo x) compared by the supproteins to be selectin. The peptide are complicated by the selectin binding of the staly lewis (SLo x) inhapes replaced by the selectin be selectin. The peptide of signist binding of HL60 cells to ELAM 1, have one or more peptide of this period by the selectin because one or more peptide.

Complete the selectin because the selection of the peptide of the selectin because the selectin because allower allyled and the selectin because the selectin be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Legidder AMSSETTA FATTA for axamples if populder and their minerius contact bind to enduched all lowbryte adhesis in secure (DLAM) it. This contact is a member of the velocite family if receptors and is involved in binding of lesbeytes in the velocite family if receptors and is involved in binding of lesbeytes in the velocite and is inflammation.

On the population if the lesbeytes in the value of inflammation or the population had been a site of inflammation.

On the population and can be used to test with the solventing affinity for the population respective and fall the following inflammation in the population of the first of the first of the first for the population of the first of the first of the population of the population of the first of the first of the population of the first

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conservation
